EXPERIENCE

Junior Software Developer Dec 2023 - May 2025
Bajaj General Insurance Company

- Built **reusable, configurable components** for Mystique, an internal **low-code platform**, reducing repetitive development effort by an estimated **30%** across multiple modules.
- Developed **secure enterprise web applications** by building frontend modules and backend **REST APIs** with **JWT authentication** and Role-Based Access Control (RBAC).
- Collaborated with cross-functional frontend and backend teams to deliver production features while improving maintainability and performance.

Full Stack Developer July 2023 - Oct 2023
Digigrowhub

- Developed and enhanced features for multiple web projects, implementing **user-facing modules,** application workflows, and project-specific functionality based on business requirements.
- Built and integrated **reusable application modules**, debugged issues across project features, and collaborated with the team to deliver project milestones.

SKILLS

Backend: TypeScript, Node.js, Express.js, Bun, WebSockets, REST APIs
Frontend: JavaScript, React.js, Angular, Tailwind CSS
Databases: PostgreSQL, Redis, MongoDB, Prisma ORM
AI/LLM: Gemini API, LLM Tool Calling, Agentic Workflows
Tools: Git, GitHub, Postman, Docker

PROJECTS

HarnessCLI: Autonomous AI Coding Agent GitHub | Live | npm
Tech Stack: TypeScript, Bun, Gemini API, React (Ink)

- Built an **autonomous AI coding agent** that understands natural-language instructions to analyze repositories, modify source code, execute terminal commands, and iteratively solve development tasks.
- Designed a **provider-agnostic LLM abstraction layer** enabling seamless integration across multiple AI providers through a unified interface.
- Published **harness-terminal** as an npm package and engineered a modular agent runtime featuring persistent memory, tool-calling orchestration, automatic retries, safety guardrails, and an interactive CLI/TUI.

Centralized Exchange (CEX): Matching Engine Simulation GitHub | Live
Tech Stack: TypeScript, Express, PostgreSQL, Redis, Prisma, WebSockets, React

- Built a **simulated centralized exchange** to understand how order matching, trade execution, and exchange architectures work.
- Implemented a **price-time priority matching engine** supporting market and limit orders, maintaining an in-memory order book for simulated trades.
- Designed a **distributed architecture** separating the API server and matching engine using Redis Pub/Sub, with PostgreSQL for persistence and WebSockets for real-time order book updates.

EDUCATION

Bachelor of Technology in Computer Science, RGPV University June 2019 - June 2023
CGPA: 8.4/10
